

# Pilots wanted:

Help design perfect Tactile Control Consoles for

## X32/M32 Rack Mixers

If you had unlimited desk space and weight to lug around, you might have gone for the full-size, desktop model of the X32. However, you opted for the rack mount model - likely because of the compact form factor and versatility of Behringer's rack mixer devices. And while in many cases, Behringer's supplied touch screen app can work just fine there are equally many cases where a touch screen interface alone is falling short of requirements. And connecting off-the-shelf MIDI or MCU controllers to X32 may not always be a practical solution when there are constraints in space, interface complexity and connection making.

We believe that the perfect Remote Controller or Remote Console for X32/M32 would be....

- highly scalable, providing access to any desired number of X32/M32 channels and parameters
- an extension to the X32/M32 iPad app, adding exactly the tactile elements you are missing
- providing access to essential X32/M32 functionality even without the presence of another touch screen
- network distributed, giving multiple users exactly the access they are supposed to have
- multi-purpose and multi-target, providing additional control of gear connected to X32/M32

Whereas multi-target is a key feature: providing control of a whole setup - and not just one device!

Here is where we at MakePro are coming in today. Our MakePro Module System, combined with our brand new and über-modern Glue software, has all these properties and can provide all those features, making **X32/M32 devices** an even more attractive solution **for**

- **Live Applications** - providing the speed, precision and confidence which a “touch” interface can not give you (multi-target: add control and automation of other live gear)
- **Installed Applications** - where access must be strictly restricted yet be conveniently available at “everyone’s finger tip” (multi-target: add control and automation of further AV gear)
- **Streaming Applications** - where integration of X32/M32 functionality into streaming controllers make access to sound parameters easier and faster than ever before (multi-target: control your video switcher and streaming software from the same device)

The MakePro Module System is ready and shipping - and pre-release versions of Glue are already neatly controlling X32/M32 via OSC command networking today.

However, it has to be the X32/M32 community which takes into action and demonstrates these great new ways to use X32/M32!

**Therefore, we are now building a group of Pilot Users who like to co-design and deploy Controllers for Perfect Integration of X32/M32.**

**The Goal** - To conceive and show a set of Controllers large and small which improve integration of X32/M32 rack mixers in various applications.

We are convinced that with highly individualized, professional grade user interfaces, the X32/M32 rack variants can be cost-effective mixing cores for more applications than ever before. Not because they are cheap, but because they are well integrated solutions! Do you see that too?

## Become a Pilot User

Conventional products are pre-determined, planned-out and static in any way you can think about them - and your role as a user is limited to your purchase. The MakePro Module System is the complete antithesis:

MakePro Solutions are conceived by talented users and are created on the fly. But even when defined, they are not static but can be refined and adapted to changing needs. This is unusual. Actually, it is unseen!

To deploy such groundbreaking technology, it requires visionaries and Pilots who become trail blazers for innovation when the power of network distributed software systems becomes controllable.

## The Rewards

**Big Fun** - Behringer and MakePro did all the hard part already - the remaining part of the journey, for which you join us, will be an inspiring and rewarding experience... we look forward to!

**Factory Support** - As a Pilot, you have the backup and support of the MakePro team. We interact directly and we will not rest until your very own X32/M32 solution comes alive.

**Savings** - In consideration of your contribution you receive an exclusive 30% discount on MakePro hardware towards your Pilot Device. As a Pilot your purchase is risk free - In case you are not happy, you can return your purchase within 90 days for a full refund.

## Flight Schedule

### 1. Briefing

We conduct a kick-off conference call covering

- how to design and build custom MakePro controllers
- integration with X32 rack and other Targets
- how to do zoning, layering and functional assignments
- discuss opportunities and biggest gains

### 2. Conception

You are now able to brainstorm and design your favourite, fully individualized Controller for the X32/M32 (and maybe other Targets in your network). In another call we will Q&A and exchange ideas on solutions other Pilots came up with. Then you decide for which Pilot Device you would like to own and once it is on your table, we support you in how to configure it and take it into action.

### 3. Test Flights

You test your Pilot Device and its features and workflows. We work with you to iron out whatever snags might be in our way and remaining gaps which may need to get filled.

### 4. Demonstrate our Success

We are Pilots so we are the first - but for sure not the last. Now we must show the world the cool stuff we have achieved.

## Make it a Business

Some of you may utilize the expertise you gained and turn it into new business. From earning commissions from evangelism to providing consulting or advanced solutions for related projects - the innovation we create together holds interesting opportunities.

## Apply for Pilot License

If you like to become part of our Pilot User Group then please get in touch via email and please tell us a bit about yourself:

What is your background, what is your application and where do you see the most potential for innovation? *We look forward to hearing from you!* Email to:
